

# Limits to the Future of U.S. Coal-Fired Electricity Generation: EPA's Clean Power Plan or Available Reserves?

33<sup>nd</sup> USAEE/IAEE North American Conference  
October 2015  
Pittsburgh, Pennsylvania

Lori Smith Schell, Ph.D., ERP  
LSchell@EmpoweredEnergy.com

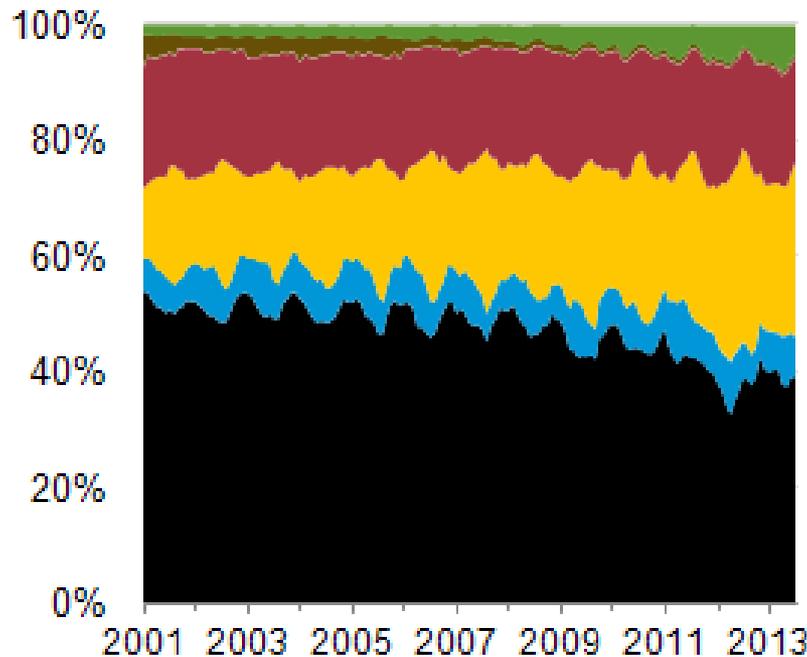

# U.S. Electricity Generation Has Been Dominated by Coal...

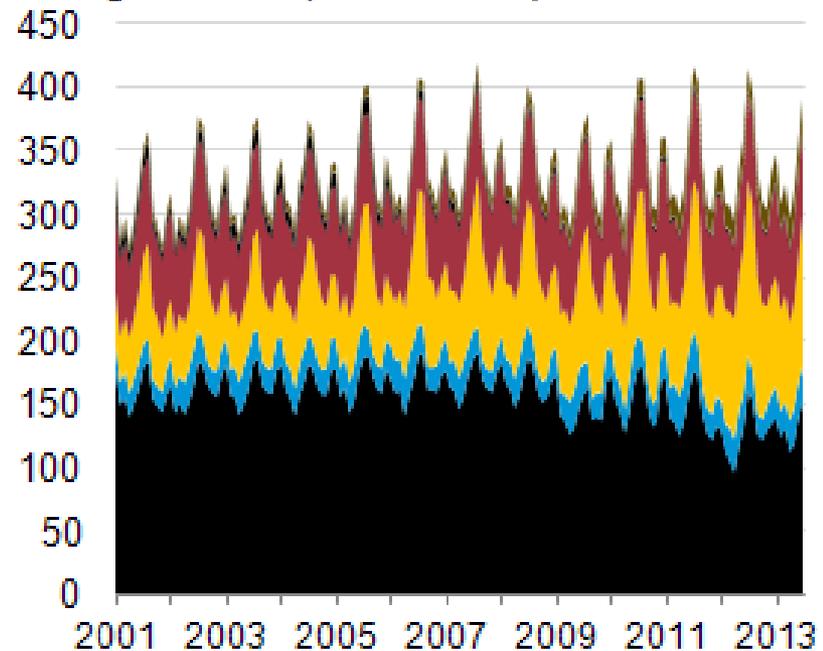

Fuel shares of total electricity generation in the lower 48 states

share of total

total generation (terawatthours)

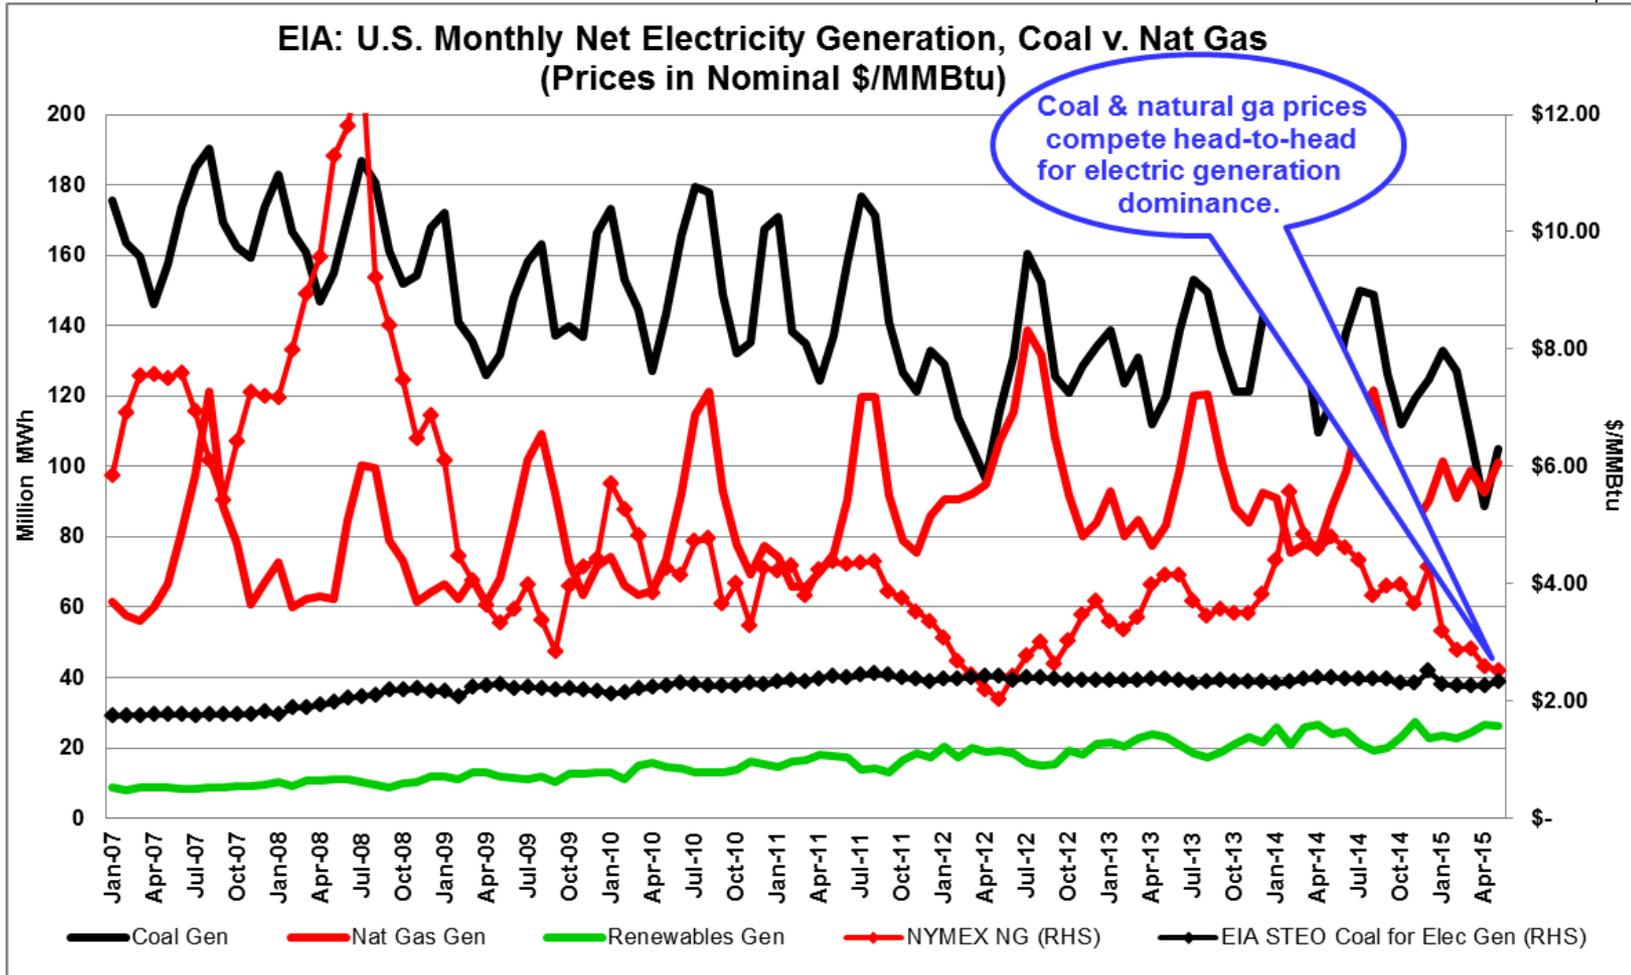

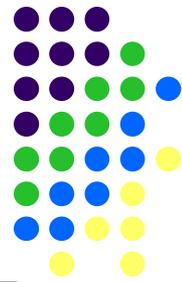

coal
  hydro
  natural gas
  nuclear
  petroleum
  non-hydro renewable
  other

**Source:** U.S. Energy Information Administration (“EIA”), Analysis of the Clean Power Plan

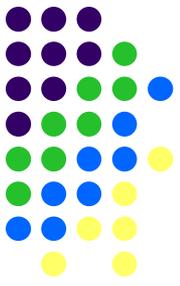

**Note:** Other refers to electricity generated from the non-biogenic portion of municipal solid waste, other non-renewable waste fuels, hydroelectric pumped storage, other energy storage, and other sources.

# But Low Natural Gas Prices Have Become a Game Changer

Source of Data: U.S. Energy Information Administration and New York Mercantile Exchange (NYMEX).

# Parameters of the Coal Reserves as Reported by EIA

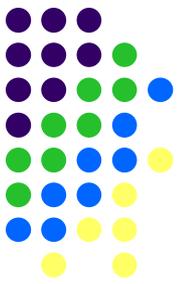

- Based on corporate self-reporting in *Annual Survey of Coal Production and Preparation* \*
- Indicate “...the amount of coal identified in the reserve that is technologically and economically feasible to extract.”
- Do “not include any specific economic feasibility criteria” performed by EIA.

Notes: Recoverable coal reserves at producing mines represent the quantity of coal that can be recovered (i.e. mined) from existing coal reserves at reporting mines. EIA's estimated recoverable reserves include the coal in the demonstrated reserve base considered recoverable after excluding coal estimated to be unavailable due to land use restrictions, and after applying assumed mining recovery rates. This estimate does not include any specific economic feasibility criteria. The effective date for the demonstrated reserve base, as customarily worded, is 'Remaining as of January 1, 2014.' These data are contemporaneous with the Recoverable Reserves at Producing Mines, customarily presented as of the end of the reporting year's mining, that is in this case, December 31, 2013. The demonstrated reserve base includes publicly available data on coal mapped to measured and indicated degrees of accuracy and found at depths and in coalbed thicknesses considered technologically minable at the time of determinations; see Glossary for criteria.

# BP's "Reserved" Support for 200 Years of U.S. "Reserves"

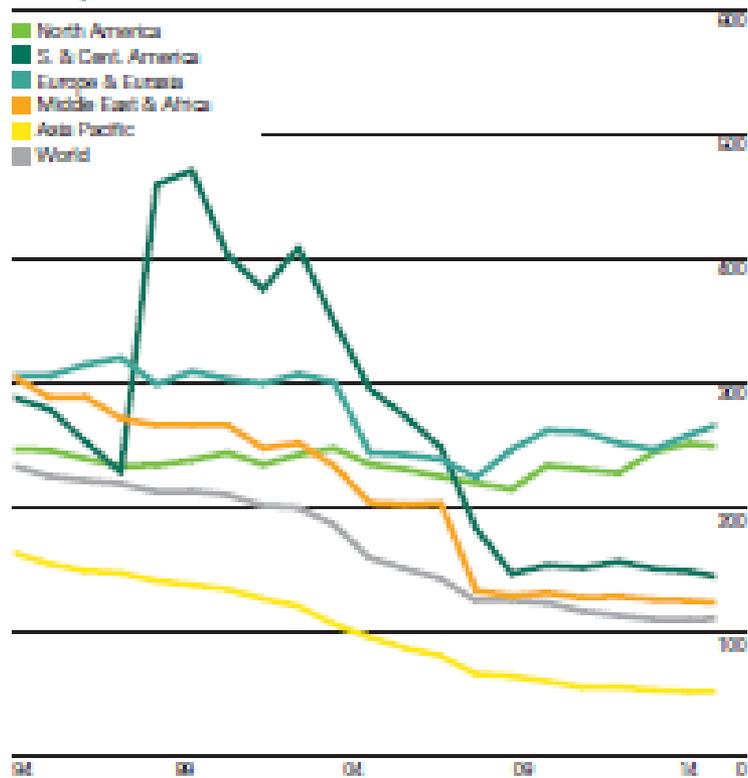

Reserves-to-production (R/P) ratios  
Years

2014 by region

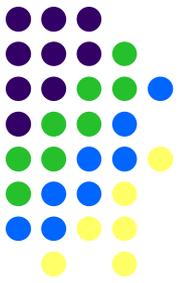

History

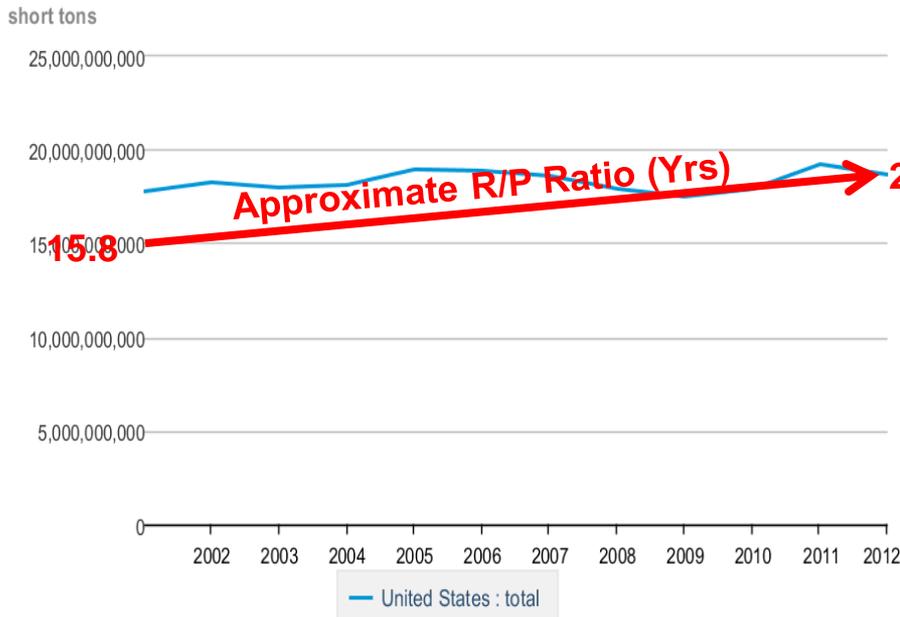

World proved coal reserves in 2014 were sufficient to meet 110 years of global production, by far the largest R/P ratio for any fossil fuel. By region, Europe & Eurasia holds the largest proved reserves and has the highest R/P ratio – 368 years, compared with 268 years for North America. The lowest R/P ratio is in the Asia Pacific region (57 years).

- Difference based on differing definition?
  - Reserve Base vs. Demonstrated Reserves

# EPA Issued Final Clean Power Plan (“CPP”) August 3, 2015

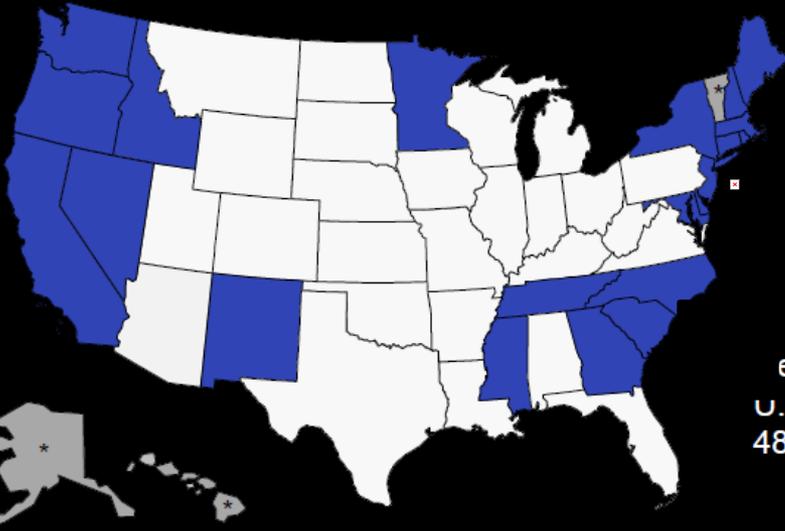

- End: Cut power sector CO<sub>2</sub> emissions 32% by 2030 (2012 base) via state-specific targets
  - Rate-based: Reduce CO<sub>2</sub>/MWh generated
  - Mass-based: Reduce absolute quantity emitted
- Means: “Building blocks” of (i) increased coal plant efficiency, (ii) swapping gas for coal, and (iii) swapping renewables for fossil fuel
- Final Rule: Increased reduction requirements for states with coal-fired generation vs. draft.

# UCS' Assessment of States' Readiness for CPP Compliance

21 States are Already on Track to Surpass Their 2022  
Clean Power Plan Benchmarks  
(Rate-Based Compliance)

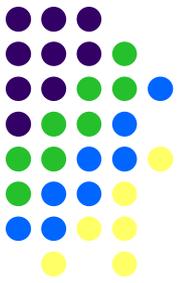

represents 46% of the  
U.S. population and  
48% of U.S. GDP

\*Alaska, Hawaii, and Vermont have no obligations under the Clean Power Plan.

# USGS Reports Much Coal Too Deep to Be Mined Profitably

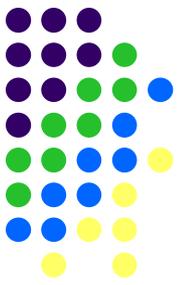

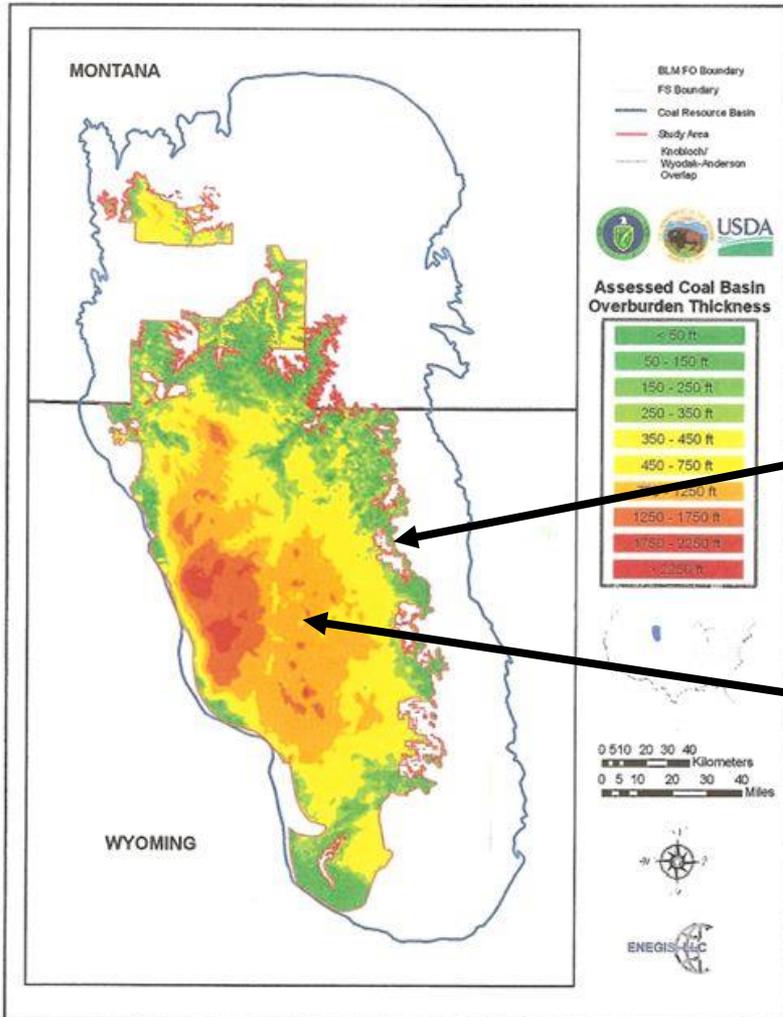

Figure 2-3. Overburden Thickness above Assessed Coal Zones in the Powder River Basin

- Powder River Basin (“PRB”) in Wyoming and Montana a major producing area
- PRB coal at 50-200’ deep is typically surface mined, but...
- Much of PRB coal lies beneath more than 750’ of overburden.

Source: U.S. Departments of Energy, Interior, and Agriculture, August 2007, Inventory of Federal Coal Resources and Restrictions to Their Development, p. 25, [http://www.law.indiana.edu/publicland/files/epact437\\_final\\_rpt.pdf](http://www.law.indiana.edu/publicland/files/epact437_final_rpt.pdf).

# 70% of PRB Coal Is Not Today Accessible by Surface Mining

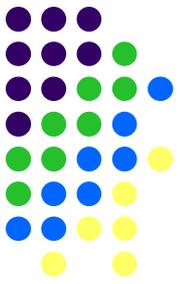

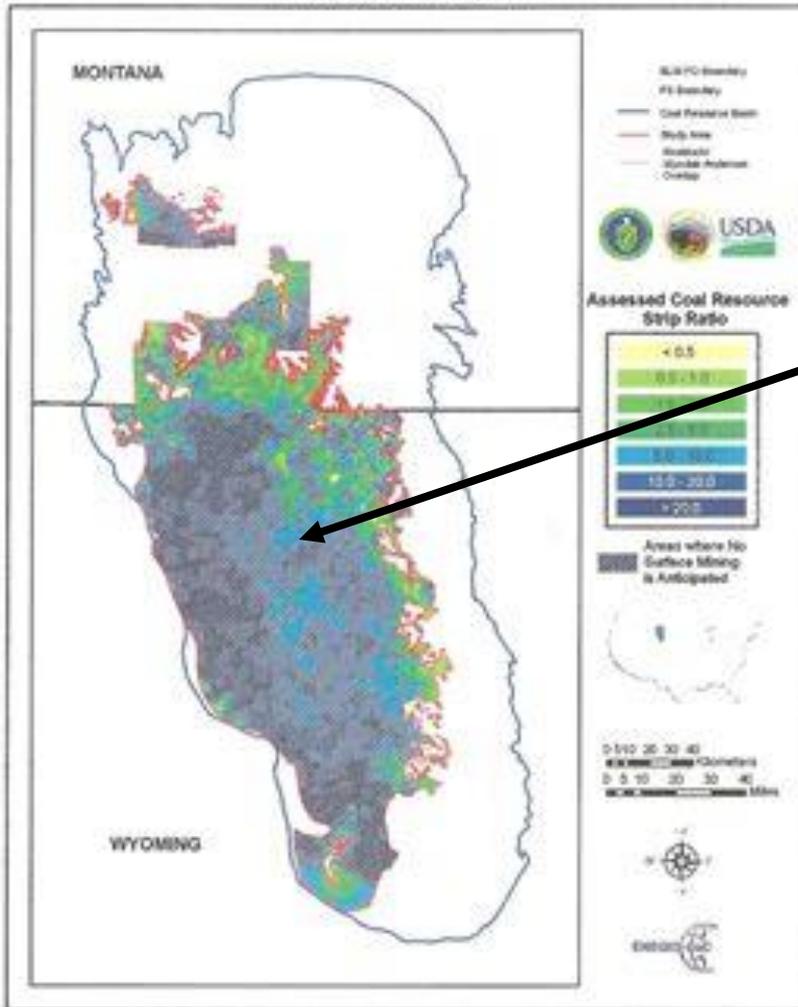

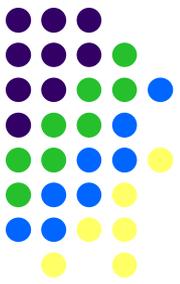

Figure 2-6. Resources beyond Conventional Surface Mining Technology in the Powder River Basin

- Blue-shaded areas = Areas where PRB surface mining is not anticipated
- Underground mining costs likely would make much PRB not currently economical to produce.

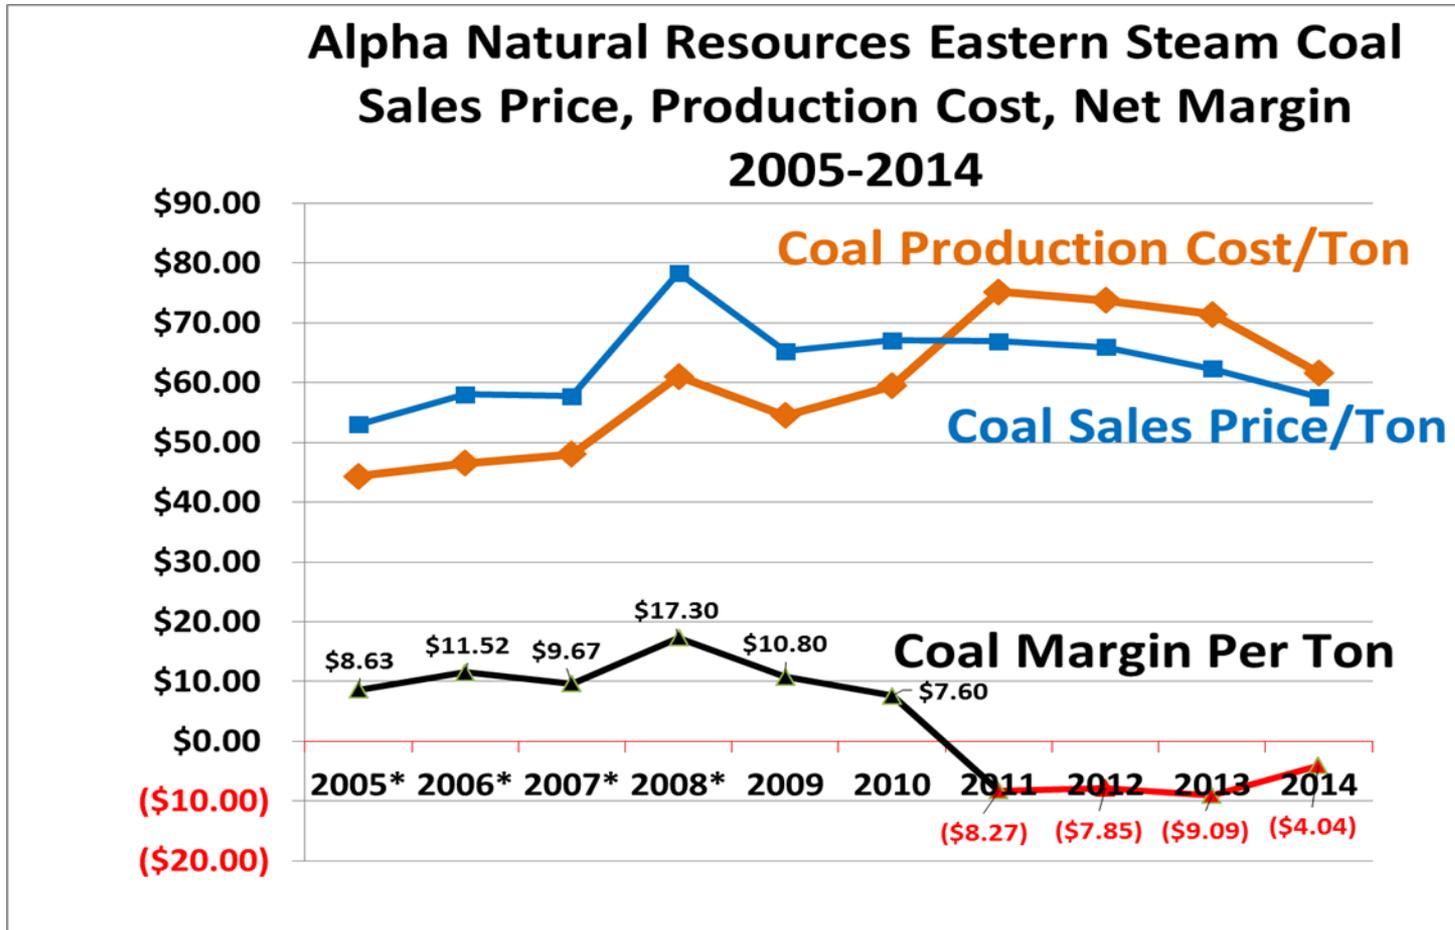

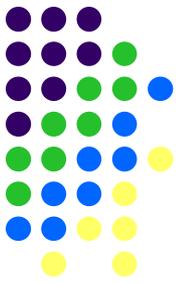

Source: U.S. Departments of Energy, Interior, and Agriculture, August 2007, Inventory of Federal Coal Resources and Restrictions to Their Development, p. 33, [http://www.law.indiana.edu/publicland/files/epact437\\_final\\_rpt.pdf](http://www.law.indiana.edu/publicland/files/epact437_final_rpt.pdf). Full details available in USGS 2008-1202 available at <http://pubs.usgs.gov/of/2008/1202/>

# #1 Peabody Former CEO Greg Boyce 3Q2013 Earnings Call:

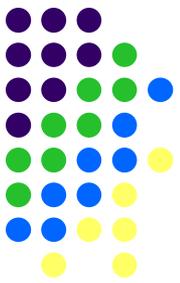

- ...our view is [the capacity out in the Powder River Basin that can come back in as prices continue to increase] it's fairly limited.
- “...people are going to have to start spending real cash to repair equipment that's been parked.....people have not spent capital to replace equipment that ultimately reached the end of its useful life or...to overcome the annual increase in stripping ratio that naturally occurs in the Powder River Basin.”

# #3 ANR Operating at Negative Margins in Eastern Coal Fields

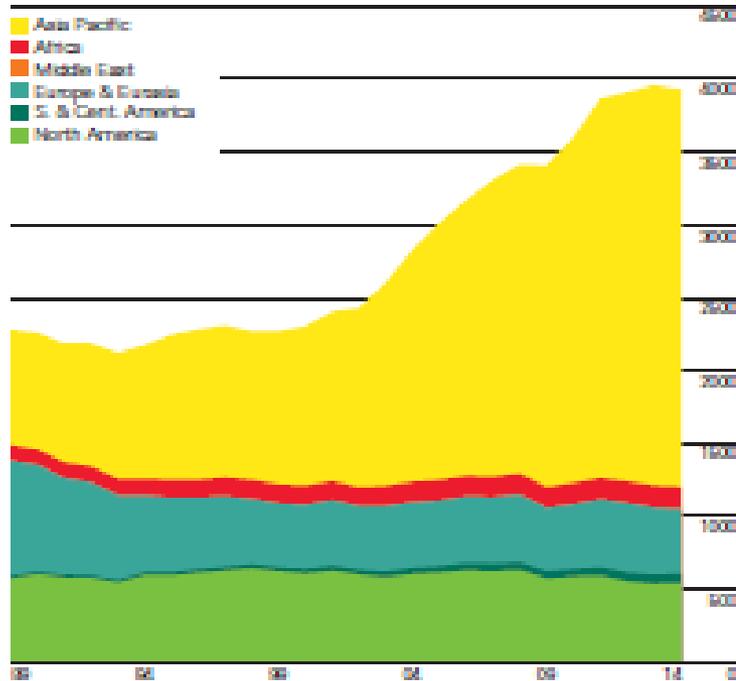

Source: Leslie Glustrom, Clean Energy Action, analysis based on data from ANR Q4 financial reports.

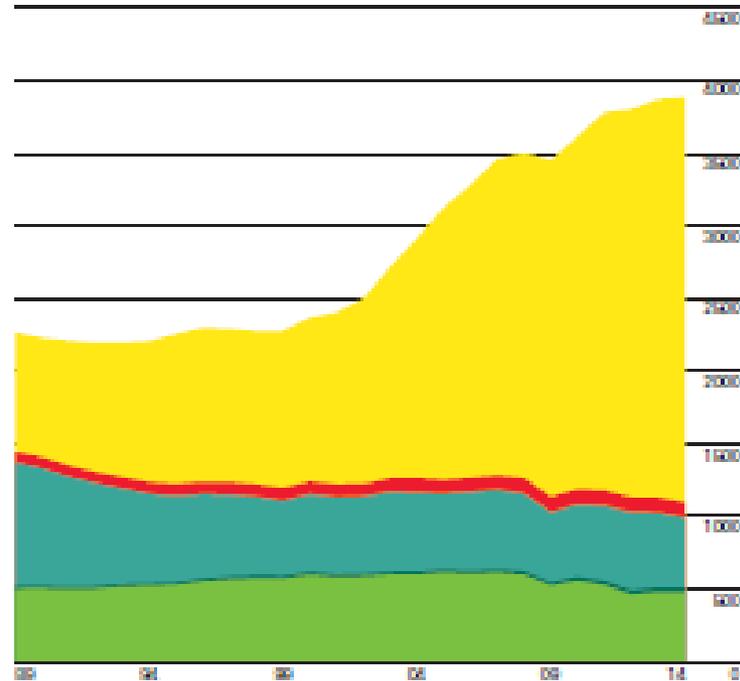

# Imports/Exports: Balancing Tool

Production by region  
Million tonnes of equivalent

Consumption by region  
Million tonnes of equivalent

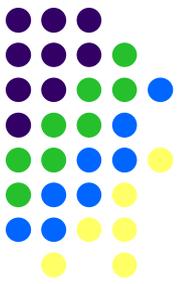

Source: BP, June 2015, BP Statistical Review of World Energy, p. 34.

World coal production declined by 0.7% in 2014, while consumption grew by 0.4%. India (+6.4%) recorded the largest production increment, while China contributed the biggest decline (-2.6%). India accounted for the largest increment to consumption (+11.1%) and Ukraine for the largest decline (-20.2%).

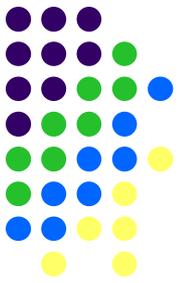

- Chinese and Indian coal imports are slowing
- U.S. coal exports unlikely to turn red ink into black ink.

# Conclusion: Multiple Factors Conspiring Against U.S. Coal

- EIA coal “reserves” may be overstated given lack of independent economic analysis
- More onerous final CPP likely to lead to more coal plant shutdowns than previously thought
- Low natural gas prices challenge coal use
- Financial distress of major U.S. coal producers likely to be exacerbated; some may not survive; operating at a loss not viable long term
- Geology of coal won’t be changed by politics.

# Null Hypothesis Tests with Major Implications in Results...

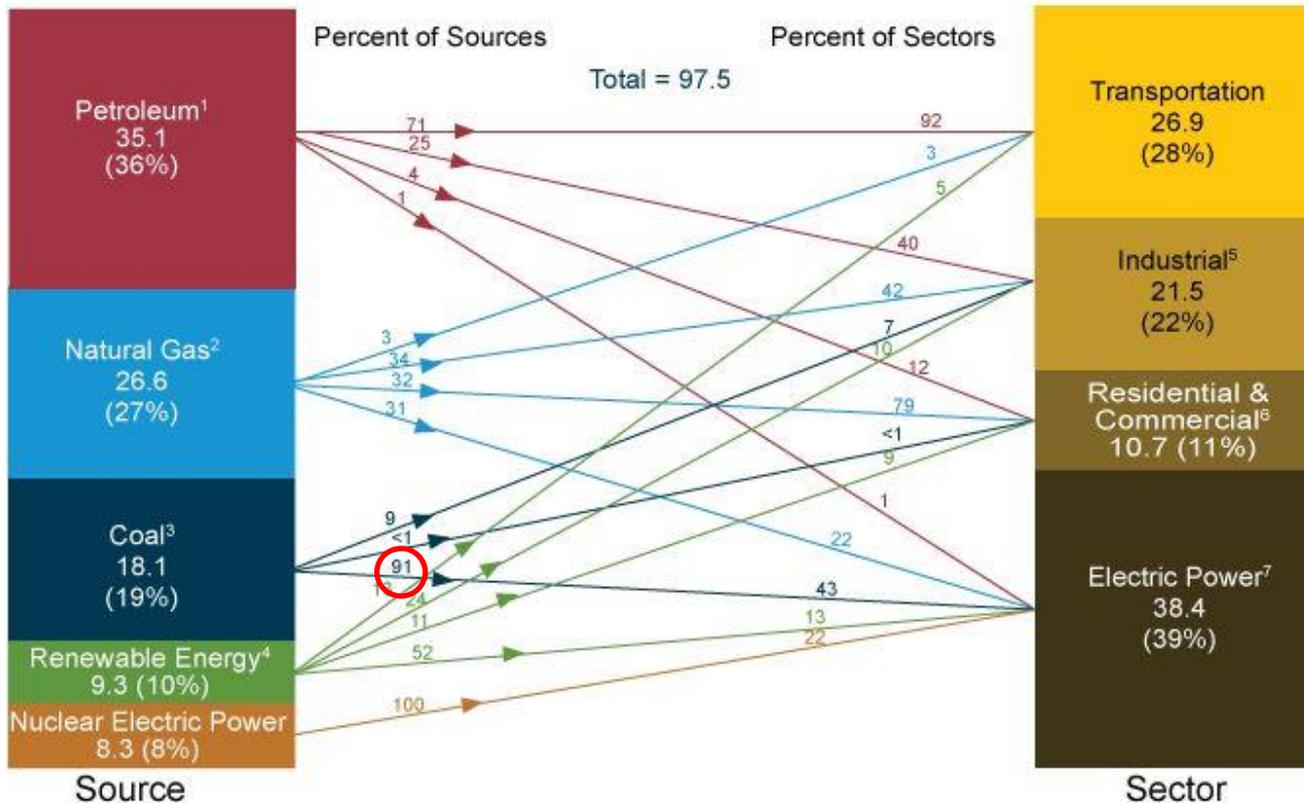

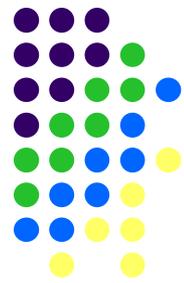

- The U.S. coal industry is in structural decline and facing geological constraints that are not likely to be overcome anytime soon; OR
- The U.S. coal industry will recover when natural gas prices increase; OR
- U.S. coal industry problems stem from Obama (Dem.) Administration policies. Under a Republican President, the U.S. coal industry will rebound quickly and remain stable.

# Primary energy consumption by source and sector, 2013

quadrillion Btu
